ABSTRACT OF THE INVENTION

The present invention relates to methods for identifying interacting regions of transcription factors, and methods for identifying agents which modulate the

- .5 interactions, useful for affecting gene regulation, for example, cellular transformation. A site within residues 130-154 and within residues 343-358 in Stat3 were found to interact with the transcription factor c-Jun. On c-Jun, a site within residues 105 and 334, and more particularly, between 105 and 263, interact with Stat3. These sites of interactions permit methods for identifying agents which modulate the interaction
- 10 between these transcription factors to modulate gene transcription.
